

CONDITIONS YOU COULD BE AT RISK TO

- Nearsightedness- difficulty seeing far away.
- Farsightedness- difficulty seeing close up.
- Presbyopia- age-related difficulty focusing on nearby objects.
- Cataracts- clouding of the lens, leading to blurry vision.
- Glaucoma- damage to optic nerve, which can lead to blindness if untreated.
- Astigmatism- blurry vision due to irregularly shaped cornea.

VISION EXAM IMPORTANCE

Doing consistent eye exams can detect early eye conditions, especially since they don't show symptoms until later on. These tests can also help doctors find other health issues like diabetes, hypertension, and cholesterol. And most of all, they help maintain good quality of life because you can see things even at an older age.

WHAT TO EXPECT IN AN EYE EXAM

- Comprehensive visual checks like eye charts, visual activity tests, and others to test your vision.
- Eye health assessments performed by your doctor to check your eye health like your retina and optic nerve.
- Intraocular pressure tests to look for glaucoma.
- Refraction test to determine your prescription for glasses and contacts.
